Knowledge coverage, unresolved inputs and review dates

Current coverage, with explicit limits

The original library is retained. Structured pages and claim records are a new layer; old guides remain searchable companions. This is an initial reviewed slice, not a claim of KernelWiki-wide audit parity.

Quantity	Count
guide	51
source-blog	1
source-dataset	2
source-doc	86
source-issue	4
source-model	5
source-pr	34

wiki-technique	4

Claim verification

- `cpu_replayed`: 8 claims.
- `source_read`: 14 claims.

GPU training reproductions: 0. Seven CPU recipes check public observations/configuration arithmetic or analytical fixtures; they do not reproduce Marin training.

Next scientific work

1. Materialize one accessible, pinned real-source subset and qualify normalization, dedup/decon and scorer compatibility.
2. Qualify one trainer/optimizer/evaluator on intended hardware, then measure throughput and resume parity.
3. Run matched mixture/HP controls with seed handling and a predeclared larger holdout.
4. Add semantic claim coverage to OLMo/Nemotron/Kimi guides and source-specific trainer/eval contracts.
5. Treat cyber transfer, recurrence and very-long-context choices as conditional experiments.

Version-sensitive contexts

Context	Frozen version	Checked	Review due
