Marin reading map

The Marin checkout is under the ignored `tmp/marin/` directory. The repository evolves quickly; check its current commit and source files before quoting implementation details in a guide.

Start with these reports and recipes

- `docs/recipes/add_scaling_heuristic.md`: workflow for selecting a reference configuration, defining a scaling heuristic, running IsoFLOP sweeps, and validating a ladder.
- `experiments/references/reference_scaling_suite.py`: executable scaling-suite pattern.
- `experiments/references/completed_adamh.py`: dense AdamH scaling heuristic.
- `experiments/grug/moe/heuristic.py`: current MoE heuristic; inspect its run context and date before treating formulas as defaults.
- `docs/reproducibility/pretraining-source-pool.md`: source-pool accounting and provenance.
- `docs/reproducibility/delphi-seed-repeats.md`: seed-repeat methodology for the Delphi ladder.
- `docs/reports/hero-mixture-log.md`: a record of mixture decisions and observed results.
- `lib/levanter/src/levanter/data/mixture.py`: implementation of mixture sampling behavior.
- `lib/marin/src/marin/scaling_laws/isoflop_analysis.py`: IsoFLOP fitting and optimal-configuration analysis.

Local web reports

- Delphi scaling suite
- Marin data pipeline overview
- Marin pretraining efficiency follow-up

Treat the reports as evidence about particular configurations and as pointers to reproducible code. A current implementation heuristic is not automatically a recommendation for another architecture, optimizer, data mix, or scale range.
